Subject: Request for Urgent Intervention and Expedited Processing of Freehold Application – Property ID 46241, 26/94 West Patel Nagar, New Delhi-110008

Respected Sir/Madam,

I am the owner of the above-mentioned property and had submitted an application in 2022 for the conversion of my leasehold property into freehold, under Application ID 191710. It has now been nearly three years, and the application continues to remain "under process" with no clear update or outcome shared by your office.

My property at 26/94, West Patel Nagar is an old and severely deteriorated structure. The building has aged significantly and is in such a state that neither repairs nor reconstruction is practically feasible without converting it to freehold status. Left with no option, I was compelled to move into a rented home, believing that the freehold process would be completed in a few weeks or months. Nowhere on the official L&DO website was it stated that the freehold process was paused or unavailable, and hence, I acted in full faith and expectation of a timely resolution.

I am a retired person from a private limited company with no pension facility, and my wife is a homemaker with no independent income, she also suffers from numerous ailments like osteoarthritis, hypertension and severe knee pain. This house is my only hope for a permanent roof over my head in my post-retirement years. The prolonged uncertainty and lack of closure around the freehold process has deeply impacted me both mentally and financially. In fact, the stress and anxiety arising from this matter were significant reasons behind my decision to take early retirement, as I could no longer manage the emotional burden along with professional duties.

Adding to my challenges, I am also a diabetic and hypertension patient, suffering from multiple age-related ailments. My health condition makes it extremely difficult - almost impossible - for me to keep visiting the L&DO office repeatedly. These frequent visits and the lack of resolution have only worsened my physical health and elevated my stress levels. This ongoing process is not just a bureaucratic delay - it has become a serious medical and emotional burden on me and my family.

Over time, this situation has led to anxiety, depression, and constant mental distress, for which I am under regular medical supervision. My doctor has directly attributed this condition to the persistent and unresolved stress caused by this pending freehold matter. I am enclosing relevant medical documents for your reference.

Despite having made multiple visits to your office, I have not received any clear response or timeline. The continued silence and uncertainty have left me feeling helpless, especially as someone who has complied with all formalities and waited patiently for years.

I earnestly request your urgent and compassionate intervention. Kindly instruct your office to expedite the processing of my freehold application and bring closure to this long-pending issue, which has not only disrupted my life but is now jeopardizing my health.

Thanking you.

Yours sincerely,
Ajay Malhotra

About Diabetes Panel

Diabetes panel is used to check how much glucose/ sugar is there in your blood. High level of Glucose levels beyond standard levels increases chances of Diabetes.

Your Results

Blood Sugar (Fasting): 172 mg/dL

METHOD: HEXOKINASE

It is measured as Glucose. Glucose is derived from carbohydrates in the diet (grains, starchy vegetables, and legumes). It is a source of energy. Pathologically increases in Shock, Burns, Diabetes Mellitus, Gigantism, Acromegaly, Pancreatic disease etc.

● HIGH

Some lifestyle changes can help keep your blood sugar levels in control

EAT LOW SUGAR FOODS THAT ARE
MINIMALLY PROCESSED

EXERCISE REGULARLY

TAKE MEDICATIONS AS PER YOUR
HEALTHCARE PROVIDER'S
RECOMMENDATIONS

HbA1c (Glycosylated Haemoglobin): 10.20%

● HIGH

eAG (Estimated Average Glucose): 246.04 mg/dL

It refers to hemoglobin that has been modified by addition of glucose. HbA1C provides a useful index of average blood glucose over the preceding 6-8 weeks. Increased glycated hemoglobin is a reflection of hyperglycemia.

People who have diabetes need this test regularly to see if their sugar levels are staying within range.

Some lifestyle changes can help keep our blood sugar levels in control

EAT LOW SUGAR FOODS

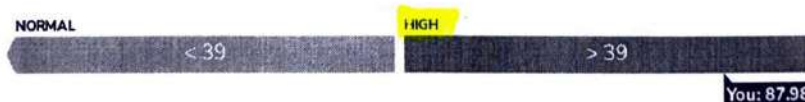

EXERCISE REGULARLY

TAKE MEDICATIONS AS PER THE DOCTORS RECOMMENDATIONS

Glycosylated Haemoglobin(Hb A1c) IFCC: 87.98 mmol/mol

● HIGH

Average Glucose Value(Past 3 Months IFCC): 13.63 mmol/L

Receiving Date: 03/May/2025
Reporting Date: 03/May/2025

Kidney Function Tests

The kidneys regulate and maintain the constant optimal chemical composition of the blood by filtration, reabsorption and excretion. Renal profile test is useful for screening and diagnosing impaired kidney function. Serum Urea and Creatinine are the most commonly used way of assessing the excretory function of the kidneys, both of which increase in diminished kidney function. Sodium, potassium, chloride increase after intensive exercise, dehydration, excessive saline or steroid therapy. They decrease in gastrointestinal loss (e.g., vomiting, diarrhoea).

Bicarbonate is increased in poor gases exchange between lungs and blood (Pneumonia, Heart failure, lung destruction), and decreased in over ventilation, diabetes mellitus, renal failure etc.

Symptoms that may indicate a problem with your kidneys include:

High blood pressure

Difficulty beginning urination

Blood in the urine

Painful urination

Frequent urges to urinate

Swelling of the hands and feet due to a buildup of fluids in the body

A single symptom may not mean something serious. However, when occurring simultaneously, these symptoms suggest that your kidneys aren't working properly. Kidney function tests can help determine the reason.

You may also need kidney function testing done if you have other conditions that can harm the kidneys, such as diabetes or high blood pressure. They can help doctors monitor these conditions.

Your Results

Blood Urea: 46.0 mg/dL

METHOD: UREASE, UV

Urea is the nitrogenous waste product generated from protein breakdown. It is eliminated from the body almost exclusively by the kidneys in urine.

Blood Urea Nitrogen (BUN): 21.5 mg/dL

METHOD: CALCULATED

BUN (mg/dL) = Urea (mg/dL) / 2.1428. Its value depends upon the Level of Blood Urea.

● HIGH

Serum Creatinine: 1.59 mg/dL

METHOD: ALKALINE PICRATE KINETIC

Creatinine is a waste product present in all body fluids and secretions, and is freely filtered by the kidney. It is produced each day and is related to muscle mass (and body weight). It is increased in diminished renal function.

● HIGH

BUN : Creatinine ratio: 13.52 Ratio

METHOD: CALCULATED

The ideal ratio of BUN to creatinine falls between 10-to-1 and 20-to-1. Having a ratio above this range could mean you may not be getting enough blood flow to your kidneys ● NORMAL

About

In simple words inflammation is your immune system's response against infections, allergens and cell injury. Inflammation can affect any organ of your body and it generally causes redness, swelling and heat in the affected part. Inflammation can be acute (for a short period of time, for example in infection) or chronic (for a very long period of time or permanent, for example in arthritis).

Excessive and persistent inflammation is damaging for your body. Chronic inflammation is associated with non-alcoholic fatty liver disease, diabetes, inflammatory bowel disease, asthma and autoimmune diseases etc

Being aware of your inflammatory status is the first step towards preventing yourself from complications of chronic inflammation. Remember, some chronic inflammations can even increase chances of developing cancers.

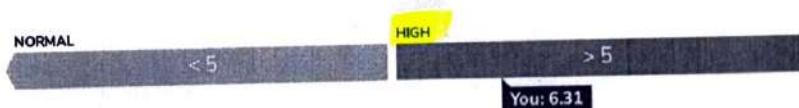

Your results

CRP: 6.31 mg/L

METHOD: LATEX PARTICLE IMMUNOTURBIDIMETRIC

CRP is a glucose bound protein helping in detecting septicemia, meningitis and to assess the activity of inflammatory diseases like rheumatoid arthritis. It is increased after Heart Attack, stress, trauma, infection, inflammation, surgery, or cancer.

● **HIGH**

Patient Name :	Mr. AJAY MALHOTRA	Age/Gender :	60 Y/M
Referred By :	Dr. PAWAN RAWAL	Ward/Bed No :	OPD
Bill Date/No :	25/09/2024 10:48AM/ OPPHI-24-25/3681	Scan Date :	
Report Date :	25/09/2024 4:54PM	STATUS	Final

Investigation : NCCT Whole Abdomen

Clinical Details:

Pain in abdomen.

Findings:

The liver is enlarged in size and shows **fatty attenuation**. No focal lesion is seen. No intra hepatic biliary radicle dilatation seen. The hepatic vascular structures are unopacified.

Gall bladder is distended and shows homogeneous low attenuation contents. The wall thickness is normal. No evidence of pericholecystic collection / intraluminal hyperdense calculus.

Portal vein and CBD are not dilated.

Pancreas is normal in size and attenuation. The peripancreatic fat planes are preserved. No evidence of dilatation of the main pancreatic duct.

Spleen is enlarged in size and shows normal attenuation.

Bilateral adrenals are unremarkable.

Both kidneys are normal in size, axis and attenuation. No hydronephrosis is seen. Multiple hypodense partially exophytic well defined lesions are noted in the mid and lower pole region of right kidney measuring approx 12 mm in the mid pole and 10 mm in the lower pole region and upper, mid and lower pole region of left kidney measuring 11 mm, 7 mm and 12 mm respectively showing no obvious wall calcification. Small radiodensities are noted in the upper and mid pole calyx of left kidney ? Randall plaque/concretions.

No size significant pre / para-aortic or mesenteric lymphadenopathy is seen.

The stomach is partially opacified with neutral oral contrast. The C loop of duodenum is defined. The small bowel loops are opacified with neutral oral contrast with no evidence of significant wall thickening / dilatation. The IC junction is defined. The appendix is visualized in the right iliac fossa region with no evidence of periappendiceal inflammation. The large bowel loops are predominantly faecal distended with no obvious evidence of wall thickening and dilatation.

Urinary bladder is partially distended. It shows diffuse wall thickening with perivesical fat stranding.

Prostate is enlarged in size. Bilateral seminal vesicles are unremarkable.

No evidence of free fluid is seen in the abdomen/pelvis.
